<b>Flight Program:</b>	ISS		
<b>Flight Assignment:</b>	Postflight data from ISS NOTE: Extended to 9/30/2017 per HRP (Ed., 1/23/17) NOTE: Extended to 10/1/2016, from original end date of 9/30/2015, per PI (Ed., 7/14/15)		
<b>Key Personnel Changes/Previous PI:</b>			
<b>COI Name (Institution):</b>	De Witt, John Ph.D. ( Wyle Laboratories, Inc. ) Hanson, Andrea Ph.D. ( Wyle Laboratories, Inc. ) Peters, Brian Ph.D. ( Wyle Laboratories, Inc. ) Scott-Pandorf, Melissa Ph.D. ( Wyle Laboratories, Inc. )		
<b>Grant/Contract No.:</b>	Internal Project		
<b>Performance Goal No.:</b>			
<b>Performance Goal Text:</b>			

<b>Task Description:</b>	Crewmembers perform exercise programs during long-duration spaceflight to counter the detrimental effects of extended microgravity exposure. Training programs include treadmill, resistance, and cycle ergometer exercise. Exercise is performed daily by each crewmember, although volume, duration, and intensity differ across individuals. Comparison of pre- to post-flight testing measures indicates that bone, muscle, and metabolic health changes vary between individuals. In this retrospective analysis, we intend to obtain the pre- and post-flight MEDB5.2 outcome measures related to bone and muscle for all crewmembers that have completed missions on the International Space Station using the Advanced Resistive Exercise Device (ARED) and T2 as their resistance and treadmill exercise devices. We intend to quantify the amount of axial loading experienced by an individual throughout their mission on ARED and T2. The results of this study will allow the identification of critical parameters that are related to exercise program success and allow for prescription optimization.
<b>Rationale for HRP Directed Research:</b>	
<b>Research Impact/Earth Benefits:</b>	Understanding how loading across multiple exercise modes influences fitness outcomes could help enhance the effectiveness and efficiency of exercise programs on Earth, especially in situations of resource (time, space, equipment, etc.) constraints.
<b>Task Progress:</b>	The purpose of this investigation was to identify the in-flight external loading factors that are associated with maintenance of skeletal muscle strength and bone mineral density during long duration spaceflight. We hypothesized that 1) Subjects who accumulated the highest magnitude ground reaction forces as normalized by body weight sustained on a week by week basis through Treadmill and resistance exercise will have protected BMD (bone mineral density) at the hip better than others in the sample group; 2) Subjects who accumulated high external loads early in their mission will have demonstrated better bone health outcomes; and 3) Subjects who accumulate greater external loading and exercise volume relative to their body weight on a week by week basis via treadmill and resistance exercise will experience the least change in muscle strength and may experience increased muscle strength as measured by isokinetic and isometric strength testing pre and post flight.
