Fiscal Year:	FY 2020	Task Last Updated:	FY 11/13/2019
PI Name:	Costes, Sylvain Ph.D.		
Project Title:	Blood-based Multi-scale Model for Cance	er Risk from GCR in Gene	tically Diverse Populations
Division Name:	Human Research		
Program/Discipline:			
Program/Discipline Element/Subdiscipline:	HUMAN RESEARCHRadiation health		
Joint Agency Name:		TechPort:	No
Human Research Program Elements:	(1) SR:Space Radiation		
Human Research Program Risks:	(1) Cancer: Risk of Radiation Carcinogen	esis	
Space Biology Element:	None		
Space Biology Cross-Element Discipline:	None		
Space Biology Special Category:	None		
PI Email:	sylvain.costes@bmsis.org	Fax:	FY
PI Organization Type:	GOVERNMENT	Phone:	650-604-5343
Organization Name:	Blue Marble Space Institute of Science		
PI Address 1:	600 1st Avenue, 1st Floor		
PI Address 2:			
PI Web Page:			
City:	Seattle	State:	WA
Zip Code:	98104	Congressional District:	7
Comments:	NOTE: After retiring from NASA, the PI Laboratory until December 2016.	joined Blue Marble. Dr. C	ostes was previously at Lawrence Berkeley National
Project Type:	Ground	Solicitation / Funding Source:	2014-15 HERO NNJ14ZSA001N-RADIATION. Appendix D: Ground-Based Studies in Space Radiobiology
Start Date:	02/04/2016	End Date:	05/31/2021
No. of Post Docs:	3	No. of PhD Degrees:	3
No. of PhD Candidates:	1	No. of Master' Degrees:	
No. of Master's Candidates:		No. of Bachelor's Degrees:	
No. of Bachelor's Candidates:		Monitoring Center:	NASA ARC
Contact Monitor:	Lewis, Laura	Contact Phone:	
Contact Email:	laura.lewis@nasa.gov		
Flight Program:			
Flight Assignment:	NOTE: Extended to 5/31/2021 per L. Lewis/ARC HRP (Ed., 9/24/20) NOTE: Extended to 5/31/2020 per PI (Ed., 11/15/19) NOTE: Extended to 9/30/2019 per F. Hernandez/ARC (Ed., 2/18/19)		
Key Personnel Changes/Previous PI:	NOTE (January 2018): The lab moved from Lawrence Berkeley National Lab (LBNL) to NASA Ames Research Center in 2017, where it was established as the Radiation Biophysics Lab in Space Biosciences Division. Dr. Costes will continue collaborating with LBNL and some funding will be left at LBNL to cover more plate processing in collaboration with Dr. Weil, Colorado State University (CSU) and for support from Dr. Snijders for the writing of the animal data. April 2017 report: - Elodie Guiet was a full time technician with a Bachelor in microbiology and biotechnology, working on this project from March 2016 until February 2017 she did not stay on the project when the lab moved to NASA Ames ; - Louise Viger was a Postdoc working partly on this project from June 2016 to January 2017 she was only here for a quick postdoc, focused primarily on modeling ; - Charlotte Degorre was a Postdoc who helped executing BNL run 16C visiting scientist for 1 month ; - Sebastien Penninckx was a PhD student who has been		

helping on data analysis visiting scientist for 3 months ; - Shayoni Ray is a new recruit at NASA Ames, postdoctoral fellow working on doing genomic analysis between animal DNA repair phenotypic data and their individual genes		
new postdoc full time at NASA Ames, started on April 10 2017.

NOTE (January 2018): The lab moved from Lawrence Berkeley National Lab (LBNL) to NASA Ames Research Center in 2017, where it was established as the Radiation Biophysics Lab in Space Biosciences Division. Dr. Costes will continue collaborating with LBNL and some funding will be left at LBNL to cover more plate processing in collaboration with Dr. Weil, Colorado State University (CSU) and for support from Dr. Snijders for the writing of the animal data. Crews on future exploration missions to Mars and other destinations in our solar system will be exposed to acute low doses (<100 mSv) and chronic low doses (<0.1 mSv/min) of high-LET (linear energy transfer) ionizing radiation from solar particle events (SPE) and galactic cosmic radiation (GCR). Predicting cancer risk associated with these radiation types is a mission-critical challenge for NASA radiation health scientists and mission planners. Epidemiological methods lack sensitivity and power to provide detailed risk estimates for cancer, mainly because the number of exposed individuals to date is relatively small, limited to several hundred individuals exposed to trapped radiation in low Earth orbit and fewer than two dozen Apollo astronauts exposed to GCR for several days at a time. Moreover, population-based studies do not take individual radiation sensitivity into account, are sensitive to the presence of other confounding environmental insults, and require long follow-up times.		
Rationale for HRP Directed Research:		
A current radiobiology challenge is the ability to predict cancer risk associated with exposure to acute (<100 mSv) and chronic (<0.1 mSv/min) low doses of high-LET ionizing radiation. Epidemiological methods lack the sensitivity and power to provide detailed risk estimates for cancer, mainly because the astronaut cohort exposed to galactic cosmic rays (GCR) is relatively small. Moreover, population-based studies do not take individual radiation sensitivity into account, are affected by the presence of other confounding environmental insults, and require long follow-up times. We have hypothesized that characterizing the dose and time dependence of 53BP1 radiation induced foci (RIF) after exposure to a systematic array of X-ray doses and time points is sufficient to describe someone's ability to respond to any other LET. The main concept is that the non-physiological response to high doses of radiation is modulated by different pools of genes. Such work provides a new approach combining novel biomarkers with sophisticated mathematical analysis to better characterize individual sensitivity to space radiation. Once validated across mice and eventually a large cohort of humans, this approach could be generalized to establish individualized health risk management for astronauts and for the population at large being exposed to ionizing radiation.		

	During year 4 the Padiation Pionhyging I shot NASA Amog has completed the majority of superiments in the hypers
Task Progress:	research part of the proposal. We have also received a costed extension to expand the sample numbers to over 750 subjects instead of the original 500 for a more rigorous analysis of genomic associations with responses to ionizing radiation, and to finish the project by May 31, 2020. The human blood sample collection is complete: we have collected samples from 762 healthy subjects, 18-75 years old, 50/50 male/female, of Northern European origin. We have irradiated all primary immune cell samples from all subjects (compared to 192 irradiated at the time of the previous report) at Brookhaven National Laboratory (BNL) in the spring 19A run and fall 19C run. We have also isolated DNA from all subjects and prepared libraries for sequencing that is scheduled in December 2019. This year we have published one primary research manuscript on the comparison of radiation sensitivity between mouse lines6 and have submitted a review on radiation countermeasures in the central nervous system (Pariset, Malkani, Cekanaviciute and Costes, International Journal of Radiation Biology). During year 3, the Radiation Biology). During year 3, the Radiation Biology. During year 3, the Radiation Biology is tab at NASA Ames has finished the mouse research component and significantly moved forward with the human research component of this proposal. Human blood sample collection to investigate genomic associations with radiation sensitivity began in February 2018, and by December 2018 we have collected, isolated, and stored peripheral blood mononuclear cells (PBMCs) from 602 healthy subjects, 18-75 years old, 50/50 male/female, of Northern European origin. We have irradiated primary immune cells from the first 192 subjects at Brookhaven National Laboratory (BNL) in the summer 18B run using 350 MeV/n 28Si, 350 MeV/n 38Ar, and 600 MeV/n 56Fe ions and gamma rays, immunostained them with DNA damage marker anti-53BP1, performed high-throughput imaging and quantification of DNA damage foci, and are in the process of analyzing the results. In addit
