	NOTE: End date changed to 09/30. NOTE: End date changed to 12/31.	/2022 per L. Juliette/JSC (Ed., 5/7/22) /2021 per information in PI report (Ed., 8/19	/21)
Flight Assignment:	NOTE: End date changed to 9/30/2 extended as internal project at NAS 9/2/2020)	2021 per F. Hernandez/ARC when PI became SA Ames; USRA grant 80NSSC20K0125 ha	e civil servant summer 2020 and project s official end date of 6/5/2020 (Ed.,
Key Personnel Changes/Previous PI:	NOTE (Ed., 9/2/2020): PI became civil servant at NASA Ames in summer 2020 ; project extended as internal project at NASA Ames and previous USRA grant 80NSSC20K0125 has official end date of 6/5/2020.		
COI Name (Institution):	Costes, Sylvain Ph.D. (NASA Ames Research Center)		
Grant/Contract No.:	Internal Project ; 80NSSC20K0125	5	
Performance Goal No.:			

Performance Goal Text:

Task Description:	One of the main risks of human deep space exploration is central nervous system (CNS) damage, which is associated with neuronal damage and neuroinflammation, caused by exposure to space radiation combined with microgravity, and can lead to cognitive and behavioral dysfunction. CNS responses to injuries are strongly regulated by astrocytes, which are a major glial cell type in the brain that has also been shown to control the blood-brain barrier permeability, essential neuronal functions, and inflammation; and thus could serve as a robust CNS-specific target for countermeasure development. Therefore, we propose to investigate the astrocytic regulation of neuronal health in response to simulated space radiation. We will investigate the morphological and physiological outcomes as well as gene expression changes after simulated space radiation exposure (5-ion simulation of galactic cosmic rays, 500 mGy) and compare them to the responses to gamma radiation in order to establish the relative biological effectiveness. We will also evaluate the necessity and sufficiency of astrocytes in regulating radiation responses by establishing experimental models where astrocytes are either the only cell type that is irradiated, or the only cell type that escapes irradiation. Finally, we will test whether driving astrocytes more towards A1 (inflammation) or towards A2 (scarring) phenotypes may serve as countermeasures by reducing radiation-mediated neuronal damage. In summary, we will examine whether astrocytes are necessary and sufficient to protect neurons from damage induced by simulated space radiation and evaluate their effectiveness as a target for further countermeasure development. We will also provide a proof of concept for human tissue-on-a-chip use for studying space radiation effects on the CNS. Our proposal addresses the Part "B. Basic Investigation Opportunity for Investigator/Institutional Principal Investigator) have combined expertise in space biology, neuroinflammation astrocyte functions, TGFbeta functions in r		
Rationale for HRP Directed Research:			
Research Impact/Earth Benefits:	 Technological. We have successfully developed human, 3D, multicellular, low footprint, high throughput (40-96 samples per standard 384-well plate) neurovascular model seeded with induced pluripotent stem cells (iPSC)-derived astrocytes and endothelial cells that retain blood-brain barrier properties and last for at least 1 week post irradiation and at least 2 weeks post seeding. This model could be used for personalized medicine approaches using iPSCs derived from specific individuals to test their responses to either therapeutic or space radiation. Scientific. We have discovered that astrocytes are particularly sensitive to ionizing radiation, especially components of galactic cosmic rays. In response to radiation, astrocytes increase oxidative stress and blood-brain barrier permeability and cause immune dysregulation, at least in part via interleukin-1 signaling. These results are important not only for deep space exploration, but also for understanding the outcomes of human central nervous system irradiation for therapeutic purposes (e.g., to treat brain tumors), and results indicate astrocytic interleukin-1 signaling as a potential target for countermeasure/therapeutic development. 		
Task Progress:	 ASTROCYTES EXACERBATE OXIDATIVE STRESS CAUSED BY SIMULATED DEEP SPACE RADIATION. We have further analyzed the neurovascular model responses to 600 MeV/n 56-Fe irradiation and observed a dose-dependent increase in oxidative stress. The presence of astrocytes exacerbated oxidative stress in irradiated models. Although oxidative stress induced by ionizing radiation, especially high-LET (linear energy transfer) particle radiation, has been extensively studied in CNS models, the relative susceptibility of astrocytes has not been evaluated previously. In combination with the role of astrocytes in exacerbating vascular permeability, this finding further indicates astrocytes as the "weakest link" in neurovascular responses to deep space radiation and a suitable target for countermeasures, and suggests oxidative stress as a key mechanism of radiation-induced damage. ASTROCYTES EXACERBATE IMMUNE DYSFUNCTION CAUSED BY SIMULATED DEEP SPACE RADIATION. One of the main functions of astrocytes is regulating CNS immune responses in health and disease. Therefore, we used astrocyte and mixed endothelial cell-astrocyte neurovascular models to investigate the effects of simulated deep space radiation on astrocyte immunoregulatory characteristics. Secreted immune cytokines revealed a dysfunction in multiple pathways in astrocytes alone and in neurovascular models. Specifically, our results suggest that radiation disrupts astrocyte immunoregulatory functions, which exacerbates the effects of radiation on endothelial cell immune cytokine production, leading to neurovascular leakiness, increased inflammation and immune dysfunction. ONGOING INVESTIGATIONS: NEUROVASCULAR RESPONSES TO 5-ION SIMPLIFIED SIMULATED GALACTIC COSMIC RAYS. Finally, during NASA Space Radiation Laboratory (NSRL) 21B campaign (June 2021), we exposed astrocyte-endothelial cell and astrocyte-neuron-endothelial cell combinations to 5-ion simplified simulated GCRs (SimGCRSim) and repeated 600 MeV/n 56Fe exposure to validate the re
