

Fiscal Year:	FY 2005	Task Last Updated:	FY 02/08/2006
PI Name:	Berkowitz, Dan E. M.D.		
Project Title:	Ionizing Radiation and its Effects on Cardiovascular Function in the Context of Space Flight		
Division Name:	Human Research		
Program/Discipline:	HUMAN RESEARCH		
Program/Discipline--Element/Subdiscipline:	HUMAN RESEARCH--Radiation health		
Joint Agency Name:	TechPort:	No	
Human Research Program Elements:	(1) SR: Space Radiation		
Human Research Program Risks:	(1) Cardiovascular: Risk of Cardiovascular Adaptations Contributing to Adverse Mission Performance and Health Outcomes		
Space Biology Element:	None		
Space Biology Cross-Element Discipline:	None		
Space Biology Special Category:	None		
PI Email:	dberkow1@jhmi.edu	Fax:	FY 410-955-0994
PI Organization Type:	UNIVERSITY	Phone:	410-614-1517
Organization Name:	The Johns Hopkins University		
PI Address 1:	Department of Anesthesiology & Critical Care Medicine		
PI Address 2:	600 North Wolfe Street		
PI Web Page:			
City:	Baltimore	State:	MD
Zip Code:	21287-8711	Congressional District:	7
Comments:			
Project Type:	Ground	Solicitation / Funding Source:	2004 Radiation Biology NNH04ZUU005N
Start Date:	07/01/2005	End Date:	06/30/2009
No. of Post Docs:	0	No. of PhD Degrees:	
No. of PhD Candidates:	0	No. of Master' Degrees:	
No. of Master's Candidates:	0	No. of Bachelor's Degrees:	
No. of Bachelor's Candidates:	0	Monitoring Center:	NASA JSC
Contact Monitor:	Contact Phone:

Flight Program:			
Flight Assignment:			
Key Personnel Changes/Previous PI:			
COI Name (Institution):			
Grant/Contract No.:	NNJ05HF03G		
Performance Goal No.:			
Performance Goal Text:	<p>An appropriate examination of the health risks associated with manned space flight necessitates an understanding of the molecular consequences of exposure to the radiations encountered in space. Human radio-epidemiologic data and animal studies indicate that irradiation of the heart can cause a spectrum of cardiovascular complications. The mechanisms suggested for these alterations are chronic inflammation induced by oxidative stress. Its well known that ionizing radiation (IR) produces biological damage by direct effect on DNA and indirectly by generation of reactive oxygen species (ROS) in the cellular milieu. The xanthine oxidoreductase (XOD) system is one of the major sources of free radicals in biologic systems. Since the XOD system is present primarily in the reduced XDH form in normal tissue, the production of free radicals is negligible. However, emerging data demonstrates that IR irreversibly converts the xanthine dehydrogenase (XDH) to xanthine oxidase (XO) leading to amplification and persistence of IR induced, ROS</p>		

Task Description:	<p>dependent cell damage. It is well known that ROS interferes with cellular signaling (nitrosylation and phosphorylation) and is pro-apoptotic (releases mitochondrial cytochrome-C and activates apoptotic pathways). One of the postulated mechanisms of radiation related tissue injury is endothelial cell damage. However little is known regarding other cellular and molecular targets in the pathophysiology of radiation induced cardiovascular system dysfunction. Furthermore little is known regarding the response of endothelial cells and cardiac myocytes to high LET radiation. In this proposal we intend to use established in vivo and in vitro bioassays to characterize the radiation response to charged particle exposure. Furthermore, mechanistically will focus on the interaction between ROS and nitric oxide (NO) pathways in the regulation of both myocardial and vascular structure and function following OS induced by high LET radiation. Our group have demonstrated the important reciprocal interaction between NO and O₂⁻ (derived from XO) in the regulation of myocardial contractility and endothelial function. We will utilize our expertise to determine the effect of radiation on these important signaling pathways in the cardiovascular system. We hypothesize that charged particles will produce an acute oxidative stress event with cellular injury and possible death with early and late consequences that are dose, LET (linear energy transfer), and time-dependent. Endothelial and myocardial dysfunction represent integrated cumulative indicators of this cellular injury. We further hypothesize that radiation induced endothelial and myocardial contractile dysfunction results from the specific imbalance in NO signaling induced by increased ROS production. In addition, we hypothesize that the XO, NOS, arginase pathways play a critical role in the response to radiation induced OS.</p>
Rationale for HRP Directed Research:	
Research Impact/Earth Benefits:	
Task Progress:	<p>Please note that this is a new grant for the FY 2005 year. The investigator will provide a task progress at the time of the one year anniversary of the grant. If you need more information, please contact the Task Book Help Desk at taskbook@nasaprs.com.</p>
